## 1. INTRODUCTION

---

### 1.1 OBJECT

In the scope of activities of INTA as responsible of Calibration and Validation Centre, an In-flight Test Plan, together with specific Data Take and Deployment Plans, were developed to be carried out after the Commissioning phase in order to have covered all the activities considered critical for a successful Operational phase.

Due to obvious similarities on the systems and calibration tools, INTA plan was based on the strategy of DLR for Terrasar-X and TanDEM-X.

In the framework of the Agreement for the Scientific Use of PAZ data [RD.2], Hisdesat requested to INTA to support the PAZ commissioning phase leading activities related to Antenna Model Verification, External Calibration and Product Characterization as stated in [RD.1], so an adaptation of INTA plans has been carried out to answer this request.

### 1.2 SCOPE

This document describes the plan for execution of the activities to be carried out by INTA CALVAL Centre during Commissioning Phase and current Product Performances analyzed with available data at the end of acquisitions over calibration field in stripmap mode configuration.

**3. OVERVIEW**

---

This document contains:

- Update of data take plan to reflect current status of Commissioning Phase with respect to the plan defined by INTA before launching:
  - Planning of stages, milestones and configuration updates.
  - Proposal of Reviews for INTA activities.
  - Activities to be performed.
- Product Performances. Current status of product performances, mainly focused on stripmap characterization.

**6. PRODUCT PERFORMANCES****6.1 TEST DATA SET****6.1.1 Geometric Analysis**

Test data set available for geometric calibration has been taken from INTA, Surat Basin and CONAE calibration fields, mostly focused on SM modes at different bandwidths.

Number of Datatakes	%
SM-S	72
SM-D	111
SC	0
SL-S	5
SL-D	22
HS-S	2
HS-D	42
PN	0
Total	258
	100

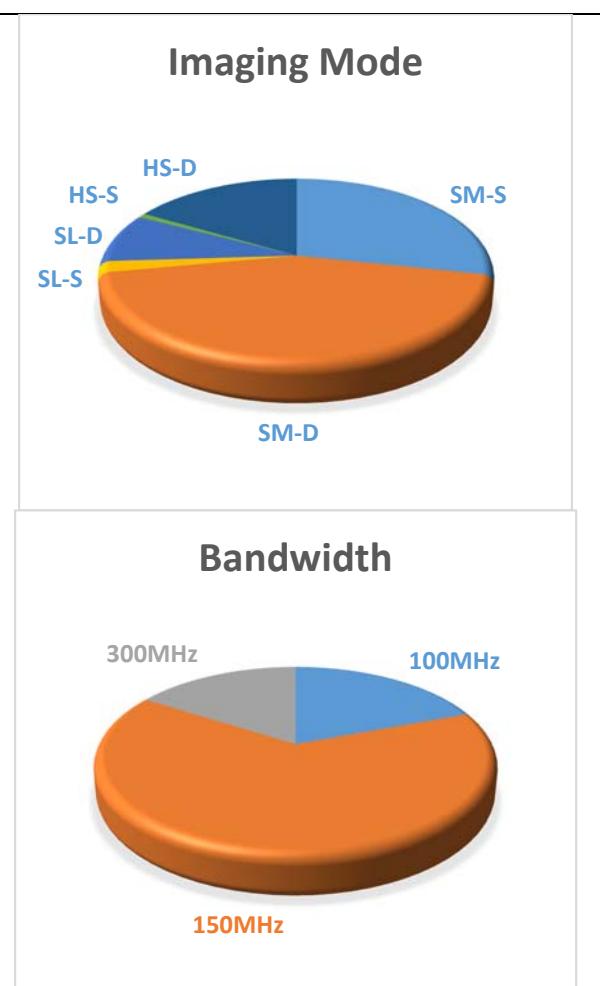

Figure 2. Test data set available for geometric analysis

### 6.1.2 Radiometric and IRF Analysis

Radiometric and IRF measurements need to precisely control the alignment of reflectors with respect to the satellite line of sight, so only INTA calibration field reflectors can be considered used for this purpose.

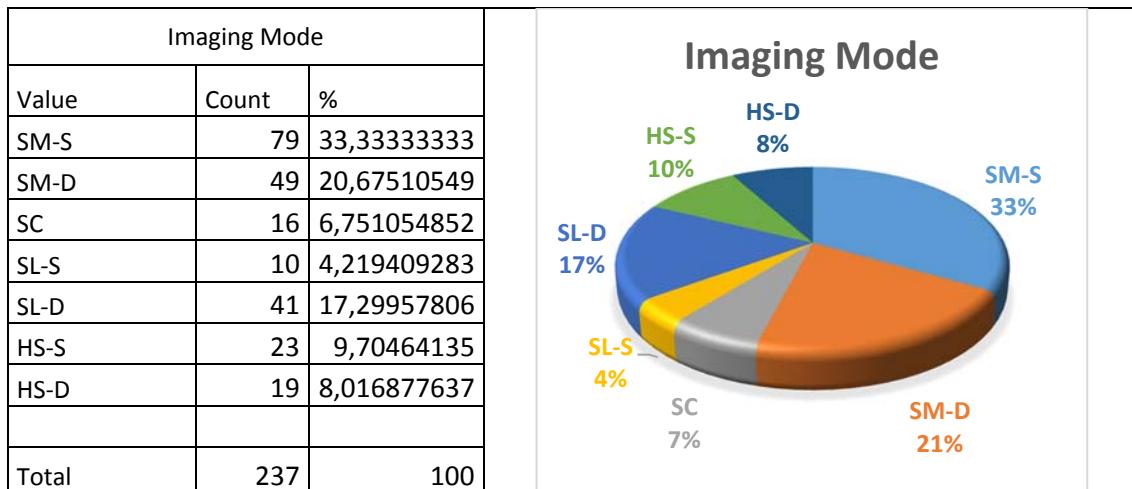

Figure 3. Test data set available for radiometric analysis by imaging mode

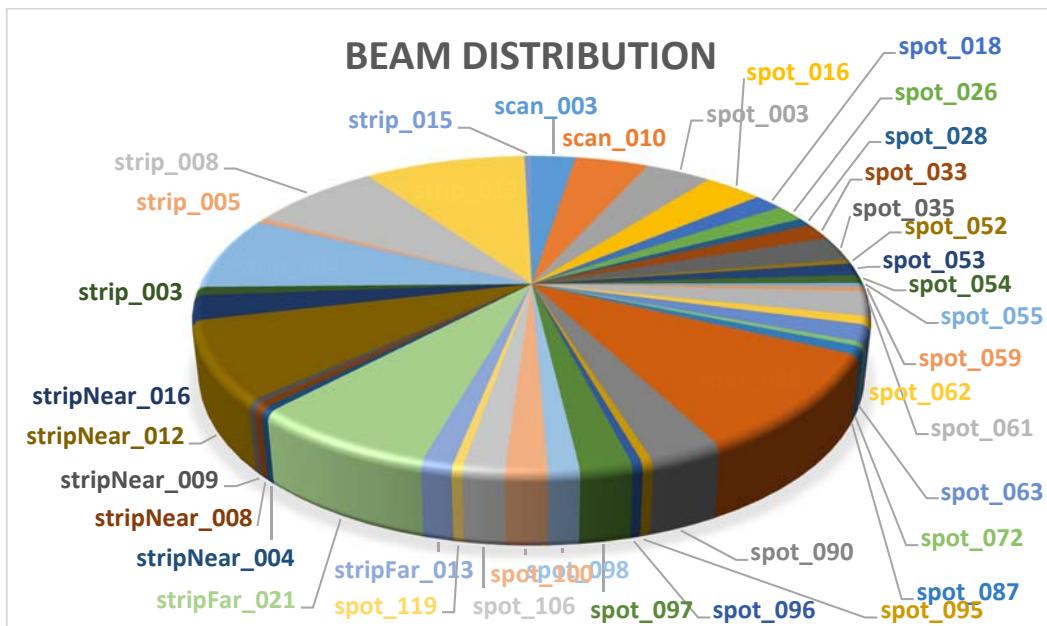

Figure 4. Beam distribution available for radiometric analysis

## 6.2 GENERAL CONSIDERATIONS

General considerations pointed out here cover three main performance areas:

1. **Focusing:** includes Range and Azimuth Resolutions, PSLR and ISLR.
2. **Radiometric Performance:** absolute and relative radiometric accuracy.
3. **Geometric Performance:** Pixel Localization Accuracy.

### 6.2.1 Focusing performances

Replica reconstructed from calibration pulses and used for focusing seems to be affected by spurious frequency components:

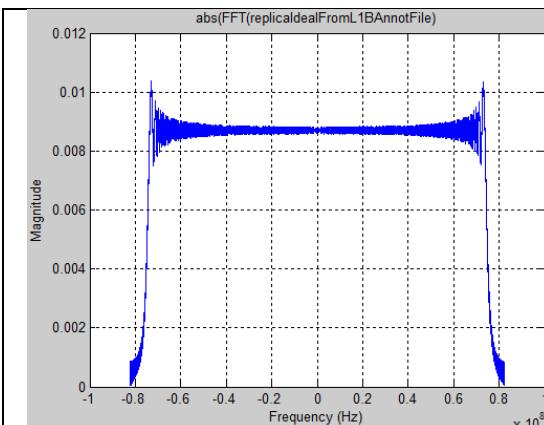

Figure 5. Ideal chirp function frequency response

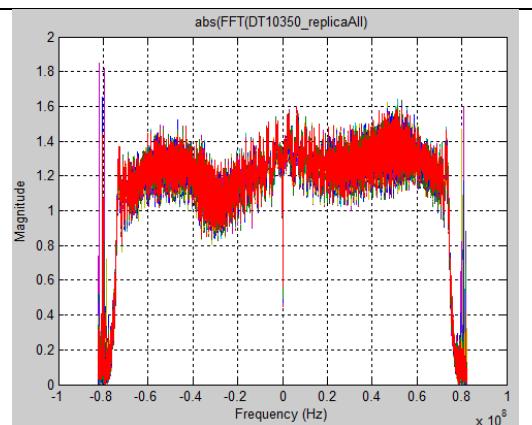

Figure 6. Replica used by processor for focusing

These spurious yields to impulse response functions over corner reflectors with PSLR and ISLR degraded:

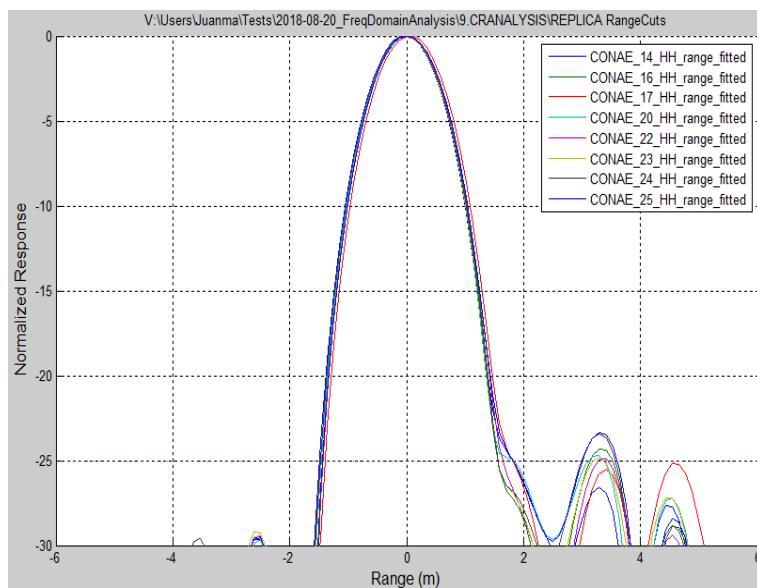

Figure 7. IRF measured over corner reflectors

PAZ

Ref: PAZ/INT/CALVAL/RPT/002

**COMMISSIONING PHASE REPORT. PRODUCT  
DEFINITION**

Iss.: 2.0

Page: 15

As the spurious signals fall out of resolution boundaries, both slant range and azimuth resolution are not being degraded in any imaging mode measured so far.

Processing using RX cal pulses as reference function improves IRF. Modification on progress.

### 6.2.2 Radiometric Performances

Strategy adopted for calibration activities are based on successful Terrasar-X calibration and consisted on:

1. Extensive on-ground antenna subarray and panel level measurements.
2. On-ground Antenna Model Verification.
3. In-Flight Antenna Model Verification.
4. Antenna Pointing Verification: verification of antenna pointing in elevation and azimuth (in PAZ case, azimuth pointing verification has been performed by ASE).
5. Radiometric Calibration: set the absolute calibration factor of the system.
6. Radiometric Characterization: determination of absolute and relative radiometric accuracies.

TSX strategy relied on extensive on-ground measurements to minimize error contributions from antenna model and a reduced number of measurements in-flight for verification.

In PAZ case, an extensive in-flight Stripmap Mode Antenna Model verification has been required to compensate the fewer measurements performed on ground with respect to TSX. Results have shown acceptable errors in shape below 0.3dB according to specification in 90% of the beams analyzed and below 0.42dB in 100%.

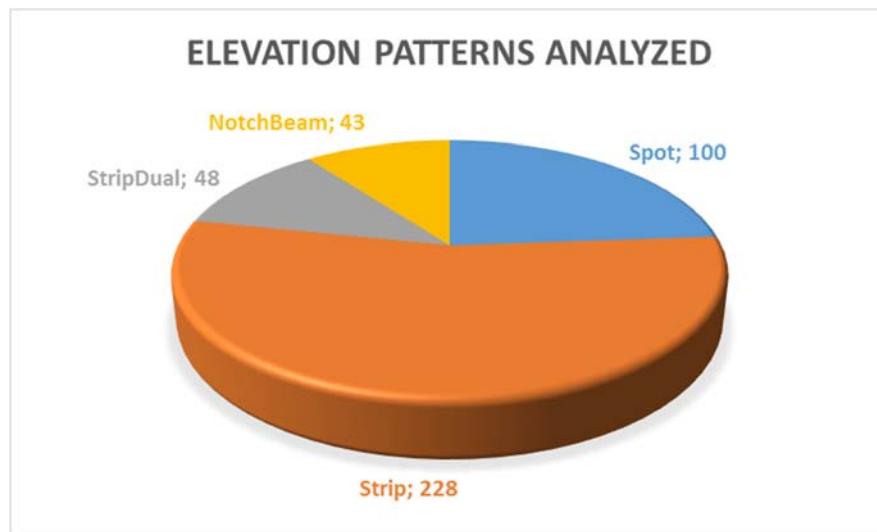

Figure 8. Reference elevation patterns analysed for Antenna Model validation

Radiometric calibration has been also based on stripmap modes since elevation antenna model should not depend on imaging mode and availability of data over the calibration field would

PAZ

**COMMISSIONING PHASE REPORT. PRODUCT  
DEFINITION**

Ref: PAZ/INT/CALVAL/RPT/002

Iss.: 2.0

Page: 16

have been unreliable on time if all imaging modes, polarization modes and bandwidths were considered.

Radiometric measurements over Spot and Scansar modes have been taken as verification of results for Stripmap, regardless a further calibration can be considered during the mission lifetime.

#### 6.2.3 Channel Imbalance

Channel imbalance tests have been performed during commissioning phase using dual acquisitions over corner reflectors and measuring amplitude and phase differences observed between channels.

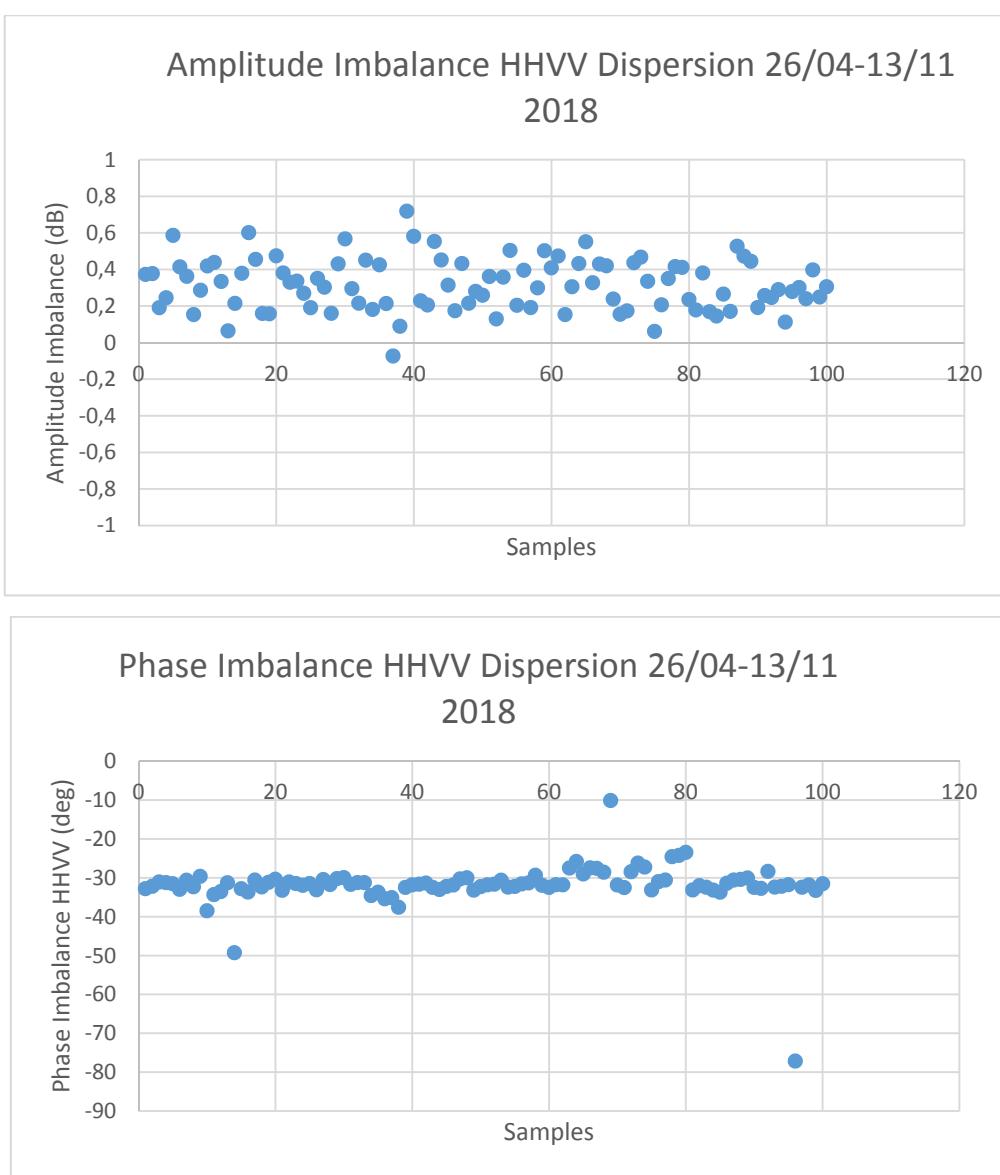

Figure 9. Amplitude and phase imbalance measured over corner reflectors

Amplitude deviation between channel measurements can also be observed in absolute calibration factor measurements if they are shown by polarization channel regardless imaging mode:

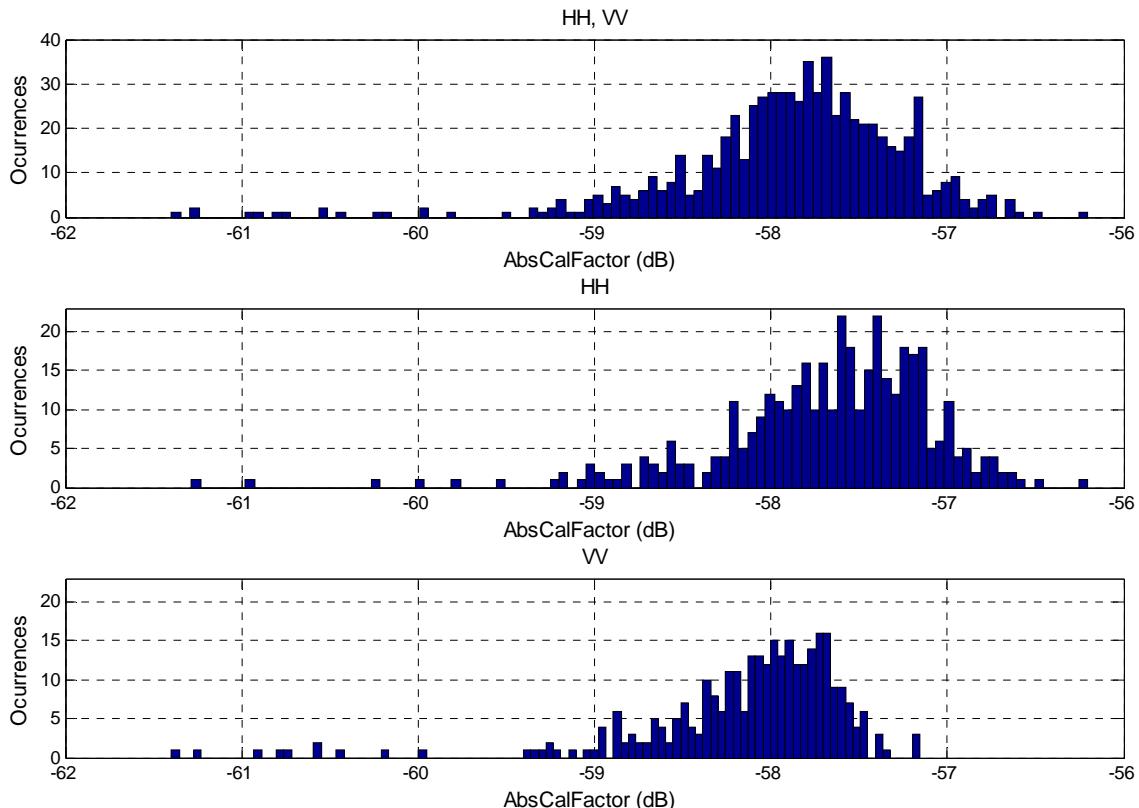

Figure 10. Histogram of measurements on All, HH and VV polarization channels

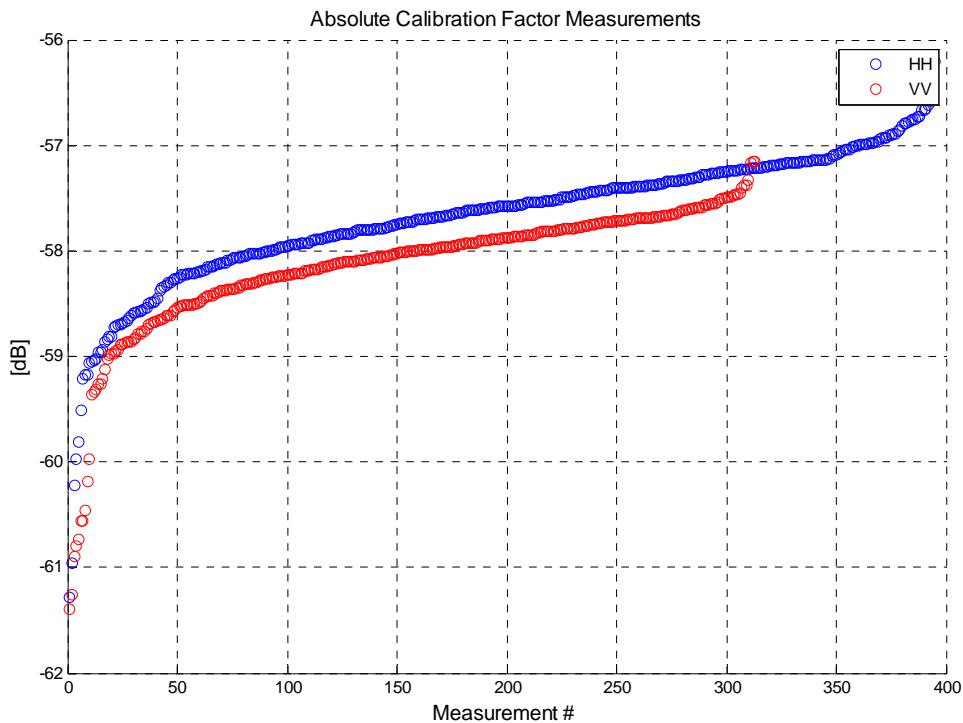

Figure 11. Summary of all CR radiometric measurements by polarization channel

As sub-array measurements provided for reference antenna pattern generation show higher gain values in VV patterns than in HH patterns, next steps will consider an offset correction both in phase and amplitude channel imbalance feature via reference antenna pattern regeneration, so an improvement on radiometric accuracy can be expected performing a ground segment configuration update.

#### 6.2.4 Geometric Performances

Pixel localization accuracy has been improved during geometric calibration activities using extensive measurements over reflectors at INTA, CONAE and Surat Basin for 100, 150 and 300 MHz data takes.

Current performances are stable and below specification, so remaining spotlight and high resolution acquisitions have been used for verification and monitoring.

## 7.9 HS-D

### 7.9.1 Range Resolution

Filter Parameters		
Start Time	2018-04-25	
Stop Time	2018-11-19	
Imaging Mode	HS	
Polarization Mode	DUAL	
PSP Quality	AUTO_APPROVED	
Look Direction	RIGHT	
Product Variant	SSC	
Resolution Variant	-	
Rx Bandwidth	150	
Beam ID	ALL	
Statistics		
	Slant Range	Ground Range
Mean	1,174646133	1,70882465
Standard Deviation	0,00774512	0,169182247
Uncertainty Type A	0,001580966	0,034534181

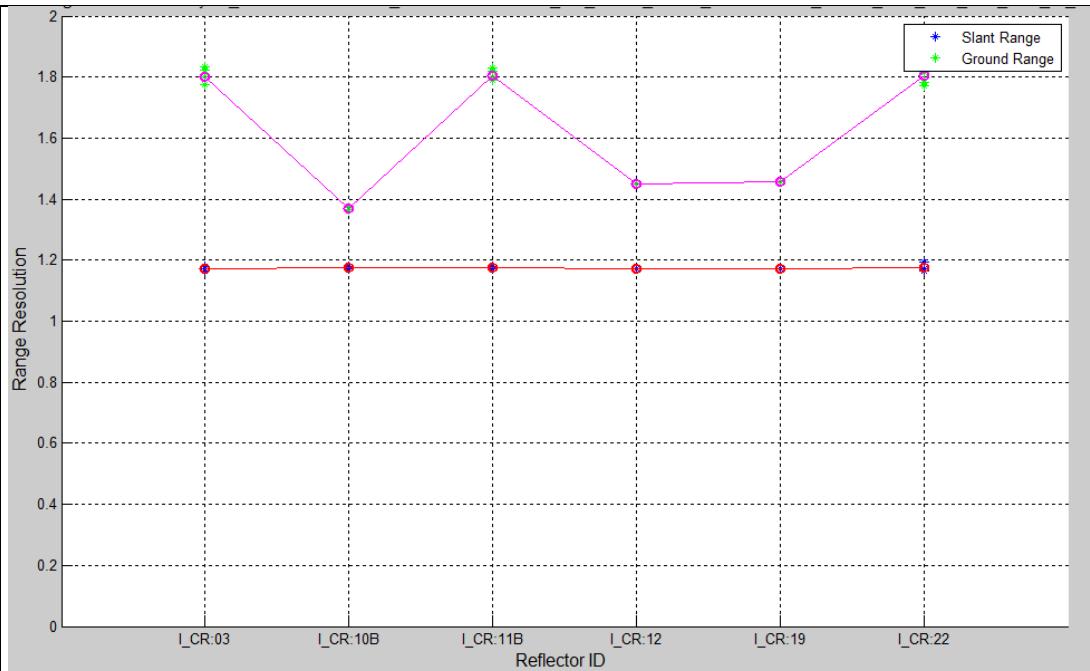

Figure 55. Range Resolution for HS-D

### 7.9.2 Azimuth Resolution

Filter Parameters	
Start Time	2018-04-25
Stop Time	2018-11-19
Imaging Mode	HS
Polarization Mode	DUAL
PSP Quality	AUTO_APPROVED
Look Direction	RIGHT
Product Variant	SSC
Resolution Variant	-
Rx Bandwidth	150
Beam ID	ALL
Statistics	
Mean	2,159179688
Standard Deviation	0,089799895
Uncertainty Type A	0,018330327

DEFINITION

## 7.9.3 PSLR

Filter Parameters	
Start Time	2018-04-25
Stop Time	2018-11-19
Imaging Mode	HS
Polarization Mode	DUAL
PSP Quality	AUTO_APPROVED
Look Direction	RIGHT
Product Variant	SSC
Resolution Variant	-
Rx Bandwidth	ALL
Beam ID	ALL
Statistics	
Mean	-25,58897045
Standard Deviation	0,930313235
Uncertainty Type A	0,140249997

DEFINITION

## 7.9.4 ISLR

Filter Parameters	
Start Time	2018-04-25
Stop Time	2018-11-19
Imaging Mode	HS
Polarization Mode	DUAL
PSP Quality	AUTO_APPROVED
Look Direction	RIGHT
Product Variant	SSC
Resolution Variant	-
Rx Bandwidth	ALL
Beam ID	ALL
Statistics	
Mean	-15,0371045
Standard Deviation	0,552203498
Uncertainty Type A	0,08324781

### 7.9.5 Pixel Localization Accuracy

Filter Parameters	
Start Time	2018-04-25
Stop Time	2018-11-19
Imaging Mode	HS
Polarization Mode	DUAL
PSP Quality	AUTO_APPROVED
Look Direction	RIGHT
Product Variant	SSC
Resolution Variant	-
Rx Bandwidth	ALL
Beam ID	ALL
Orbit Precision	3-SCIE
Statistics	
Mean	0,683169942
Standard Deviation	0,118906788
Uncertainty Type A	0,017925873
